OK Erik Linde – IT operations & monitoring engineer

```
| hosts=6000 markets=7 experience=6y stack=linux oncall=yes
```

Six years in IT operations, from service desk and SLA management through MSP tooling to infrastructure monitoring. Today that means observability for roughly 6,000 Ubuntu hosts across seven European markets: the Icinga2 estate, the pipeline behind it, and the integrations that connect monitoring to asset management and ITSM. I build the tooling I need rather than wait for it. Comfortable from kernel parameters and systemd up to SLA definitions and stakeholder reporting.

\$ cat skills.txt

monitoring	Icinga2, Icinga Director, Nagios plugin development, Prometheus, Grafana, Vector.dev, QuestDB, SNMP, alerting and escalation design
linux	Ubuntu / Debian, systemd and timers, kernel parameters and boot config, sysfs, APT package management, users and SSH key management, SSH at fleet scale, Ansible provisioning and config management
windows	Windows Server monitoring and patching at MSP scale (ConnectWise Automate), Active Directory, Intune / SCCM, PDQ Deploy, PowerShell
automation	Python, Bash / shell, SQL, PowerShell, REST and JSON API integration
infrastructure	Docker, Kubernetes, Windows Server, Consul, WireGuard, Git, AWS (S3, Lambda, DynamoDB, CloudFront), Azure, GitHub Actions, Argo CD, secret management (1Password / Varlock)
itsm	HaloITSM, Zendesk, ServiceNow, ConnectWise (Automate / Manage / Control)
practice	ITIL incident and problem management, SLA definition and reporting, escalation design, AI-assisted engineering

Monitoring Specialist @ Bauer Media Outdoor

11/2021 – present · Stockholm · formerly Clear Channel International, acquired by Bauer Media Group April 2025

Responsible for monitoring and availability across roughly 6,000 Ubuntu hosts in seven European markets – Norway, Denmark, Sweden, the UK, Ireland, Poland and the Netherlands, and previously also the Baltics, Spain, France and Italy. Daily work with international field and operations teams.

- **Observability platform.** Run the Icinga2 estate – master, satellite and agent topology, managed through Icinga Director – and the pipeline around it: Prometheus for metrics, Vector.dev log shipping into QuestDB time-series storage, both surfaced through Grafana. SQL-backed dashboards for trend and root-cause analysis, plus automated availability reporting for stakeholders.
- **Automation and ITSM integration.** Automated host registration in Icinga2 against the asset management API, removing manual onboarding entirely. Integrated Icinga2 with HaloITSM so alerts open tickets bound to the correct asset, and synced downtime between monitoring and ticketing over Python and JSON APIs.
- **Linux fleet operations.** SSH at fleet scale, with TeamViewer for the faults that need a desktop rather than a shell, systemd and kernel boot configuration, Ansible for provisioning and estate-wide configuration changes, and a documented map of which failure modes recover remotely and which need out-of-band intervention – AMT, rtcwake, or a switched PDU.
- **Check plugin development.** Icinga2 plugins in Python, Bash and PowerShell against SNMP, JSON APIs and SQL, including hardware-level health checks (DDC/CI via ddcutil, sysfs EDID validation, screenshot pixel-hash deltas) that catch failures xrandr and VNC report as healthy.
- **Problem management.** Traced recurring fleet-wide failures on Intel Gen 9/9.5 hardware to i915 panel self-refresh and rolled the kernel-parameter fix out estate-wide. Separately, traced playback failures to a `JSON.parse('')` crash triggered by empty backend responses – a server-side degradation assumed for months to be a client fault – and shipped a check to detect the pattern proactively. Also traced a recurring fault in our own domain to DNS caching – stale answers kept being served after records changed, so the symptom returned on a TTL cycle rather than staying fixed – and corrected the TTLs so changes take effect when they are made.
- **Infrastructure remediation.** Led an Icinga2 PKI remediation across masters and satellites: CA distribution, ticket_salt configuration, and zone and dependency type mismatches that were causing silent check failures. Restored monitoring coverage on every affected host.
- **SLA reporting.** Built the operational-uptime calculation behind stakeholder reporting – downtime clipped to per-day payout schedule windows and weighted by venue status classification.
- **Self-healing design.** A SQLite-backed remediation state machine enforcing one action per incident, with check and retry intervals tuned to damp alert flapping.
- **Fault visualisation.** Integrated a camera API into an internal operations site, turning per-host checks into a visual overview of estate condition – faults and screen brightness reviewable from one page instead of host by host. Delivered through the team's GitOps pipeline, GitHub to Argo CD, landing on the test cluster to verify before the same change was promoted to production.

Icinga2 · Icinga Director · Prometheus · Grafana · Vector.dev · QuestDB · Ansible · Kubernetes · Argo CD · Consul · WireGuard · TeamViewer · HaloITSM · Zendesk · PDQ Deploy

Application Specialist / Technical Account Manager @ Innosoft AB

06/2020 - 11/2021 · Stockholm

Supported MSPs and system administrators across the ConnectWise suite – system setup, best practice, and resolution of technical issues.

- **Automate (RMM)**. Monitored Windows Server and endpoint estates across MSP customers, applied patching, deployed applications with PowerShell scripting, and built SQL-based alarms and reporting on database changes.
- **Manage (PSA)**. Ran ticketing under ITIL processes, invoicing and sales flows. Built and analysed the SQL reports MSPs used to demonstrate value to their own clients, and resolved system issues and API integrations.
- **Control**. Built remote support portals and troubleshoot remote session and tooling issues, in Control and TeamViewer.

ConnectWise Automate · Manage · Control · TeamViewer · Windows Server · SQL · ITIL

Dispatch (SLA Manager), Helpdesk Coordinator, Helpdesk Agent @ H&M Global Helpdesk

2018 - 2020 · Stockholm

- **Dispatch / SLA manager**. Ran ticket distribution in ServiceNow, holding pickup inside 15 minutes and resolution inside SLA.
- **Operation centre**. Monitored critical systems, handled alarms, and drove escalation during outages alongside the incident manager.
- **Helpdesk coordinator**. Staffed service desk roles to keep phone response under 3 minutes and email response within 48 hours.
- **Agent and KCS coach**. Remote troubleshooting, Active Directory access management, application deployment via Intune and SCCM. Coached agents on writing effective knowledge articles, with monthly follow-up.
- **Information flow**. Led communication during major incidents, including emergency messaging and escalation to the global incident manager.

ServiceNow · ITIL · Active Directory · Intune / SCCM · KCS

Customer Support Agent @ Telia

2016 - 2018 · Stockholm

First-line support by phone, chat and email – initially through Randstad, then employed directly by Telia. Diagnosed customer networks and Wi-Fi issues and delivered fixes end to end.

\$ ls -l ~/projects

bastion · self-hosted SSH operations console

Web console for fleet SSH management, running in a container bound to localhost. SSH agent socket forwarding so private keys never enter the container, `~/.ssh/config` as the single source of truth, and a plugin architecture covering terminal (ttyd / xterm.js), VNC (noVNC), file browsing and LLM-assisted log analysis. Security model built on an SSH certificate authority issuing short-lived certs, OIDC, and audit logging into the same Vector / QuestDB pipeline.

icinga2-monolith · one-command monitoring stack

Idempotent provisioning of a complete single-server monitoring stack on Ubuntu 20.04 through 24.04 – Icinga2, IcingaDB, Redis, MariaDB, IcingaWeb2 and Apache/PHP – from one `setup.sh`, with generated credentials written to a known location. Built to rebuild a monitoring estate from bare metal without a runbook.

agent-safe secrets · 1Password + Varlock

Injects `op://` references into containers so automated agents receive scoped API credentials – Icinga, HaloITSM – without resolved plaintext ever passing through shell arguments or stdout.

icinga-dexcom-check · github.com/leriklinde/icinga-dexcom-check

(<https://github.com/leriklinde/icinga-dexcom-check>)

Python Icinga2 plugin that pulls CGM data into a standard monitoring stack, so homelab users can alert on blood glucose the same way they alert on anything else.

cloud resume challenge · AWS serverless site

The Cloud Resume Challenge end to end on AWS: a static site in S3 behind CloudFront with a Route 53 domain, a visitor counter served by a Lambda function URL against DynamoDB, and a GitHub Actions workflow deploying the site on every push to `main` through an IAM role scoped to the bucket.

insider-signal · Python data pipeline

Daily-runnable tool that ingests Finansinspektionen's insider registry of Swedish MAR disclosures, maps ISINs against Nasdaq Nordic data, joins price history via `yfinance`, and surfaces alerts from a normalised SQLite schema.
